Sustainable Streets

Complete Streets + Green Infrastructure

Sustainable Streets provide safe mobility and access for all users with the added environmental and community benefits of green infrastructure

WHAT ARE SUSTAINABLE STREETS?

SUSTAINABLE STREETS provide **safe mobility** and **access for all users** with the added environmental benefits of green infrastructure to **collect and clean stormwater runoff** in place, minimize the burden on the storm and sewer systems, and **protect our creeks, the Bay, and Ocean**.

¹ There is approximately 20% increase in runoff from the roadway network for the 10-year storm. Storm drain systems in the county are typically sized for the 10-year storm.

Benefit of ALL Green Infrastructure on Reducing Runoff

- GI offsets 30% of the projected increase in all runoff for the 2-yr storm
- Benefits of GI decreased with increasing storm size

Benefit of Sustainable Streets on Reducing Road Runoff

- Sustainable streets offset >100% of the projected increase in roadway runoff for the 2-yr storm
- Benefits of sustainable streets decrease with increasing storm size

A GUIDE TO EATING FISH *from* SAN FRANCISCO BAY

(ALAMEDA, CONTRA COSTA, MARIN, NAPA, SAN FRANCISCO, SAN MATEO, SANTA CLARA, SOLANO, SONOMA COUNTIES)

**WOMEN 18 - 45 YEARS AND
CHILDREN 1 - 17 YEARS**

Eat the Good Fish

Eating fish that are low in chemicals may provide health benefits to children and adults.

Avoid the Bad Fish

Eating fish with higher levels of chemicals like mercury or PCBs may cause health problems in children and adults.

Choose the Right Fish

Chemicals may be more harmful to unborn babies and children.

Brown rockfish

Chinook (King) Salmon

♥ high in omega-3s

Jacksmelt

Red rock crab

California halibut

White croaker

Sharks

White sturgeon

Surfperches

Striped Bass

Serving Size

A serving of fish is about the size and thickness of your hand. Give children smaller servings.

For Adults

For Children

Some chemicals are higher in the skin, fat, and guts.

Eat only the
skinless fillet

Eat only the meat

SSMP Project Prioritization Process

Identify Planned and “New” Project Opportunities

- Define Sustainable Street Typologies
- Find active transportation projects from existing plans
- Find “new” opportunities near schools and transit
- Screen projects based on feasibility to integrate green infrastructure

Prioritize Opportunities

- Pair opportunities with stormwater analysis and community benefit criteria
- Create ranked top opportunity lists for each community

Identify Recommended Projects

- Incorporate stakeholder feedback on project opportunities
- Refine project boundaries
- Develop funding linkages
- Establish project phasing

Develop Project Concepts

- Identify high-priority project opportunities with near-term implementation timelines
- Develop project concepts across typologies
- Create strong visual renderings
- Focus on multiple benefits and planning level cost estimates

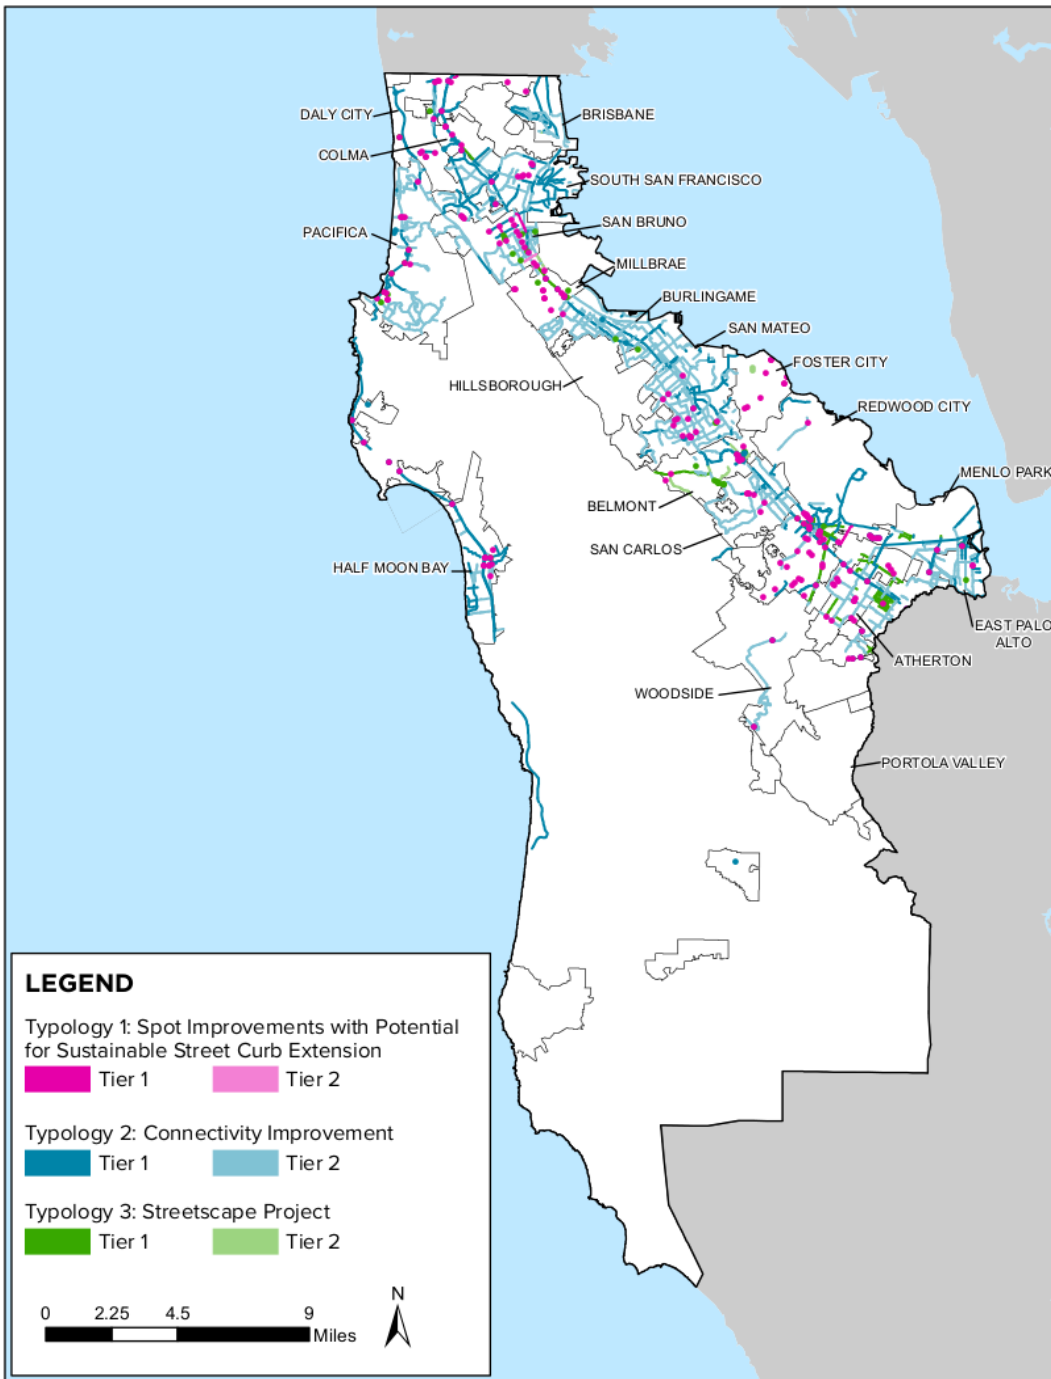

Existing Planned Project Opportunities

Three Project Typologies

- Sustainable Street Curb Extensions
- Sustainable Street Connectivity Improvements
- Sustainable Streetscape Projects

Two Project Tiers

- Tier 1 projects have more potential to cost-effectively incorporate GI due to extent of construction impacts

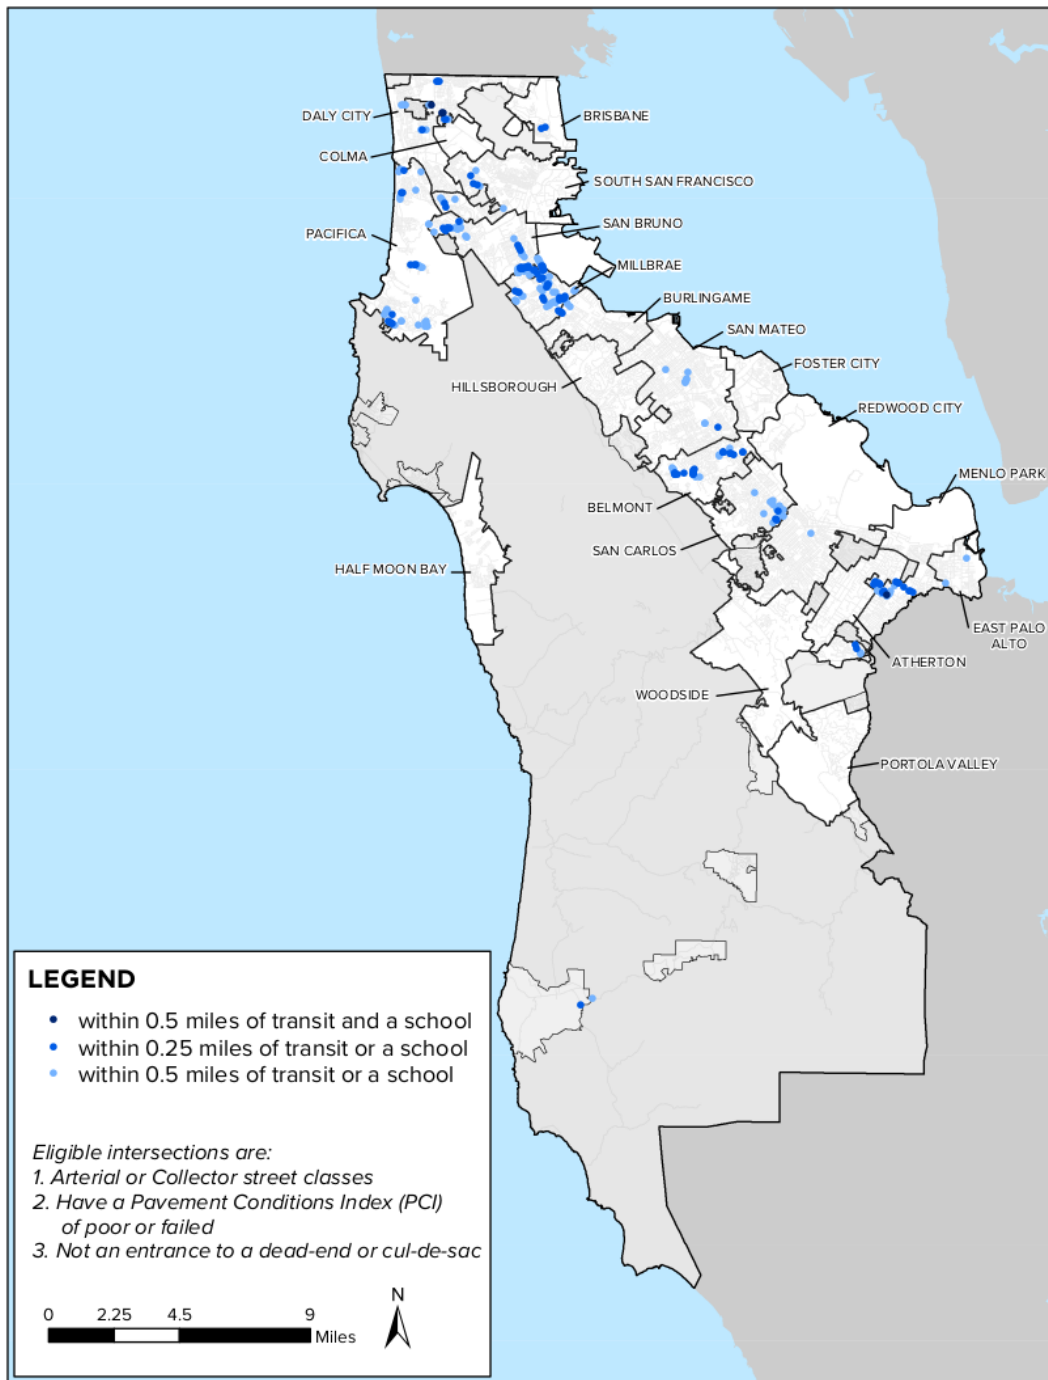

“New” Project Opportunities

Goals

- Support Safe Routes to School and Transit Program objectives
- Support cost-sharing and construction impact reduction objectives by locating opportunities where pavement is in poor condition

New Curb Extension Opportunities:

- Intersections within 0.5mi walking distance from schools or major transit stops
- Arterial or collector streets
- Poor pavement condition

Prioritized New Opportunities

El Camino Real Colma

Concept Description

El Camino Real (State Highway 82) through the Town of Colma is being redesigned with pedestrian and bicycle improvements. The design includes new landscaping, the addition of a protected bike lane in both directions, new signaling, and a lane reduction from C Street to Mission Street. This concept proposed to integrate green stormwater infrastructure in the planned transportation improvements.

The proposed vegetated median separating the bike lanes from vehicular traffic is 5 to 6 feet wide. At T-intersections and at intersection approaches the proposed median widens to 10 to 13 feet. Portions of the vegetated median on the northeast side of El Camino Real can be installed as bioretention facilities that collect and manage stormwater runoff from the roadway, bike lanes, and sidewalks. The remaining portions of the median

can be landscaped with trees and graded to direct flow towards the bioretention areas. The proposed median on the southwest side of El Camino Real is located above a water main making bioretention facilities infeasible.

The bioretention facilities are shown for the block extending north of Collins Road representing a typical block within the corridor. The same design can be applied to the full extent of improvement from C Street through Mission Street. The proposed bioretention facilities shown on the typical block represent 3,300 square feet of facilities. This project will manage stormwater from 1.9 acres of roadway and provide capture of 3.5 acre-feet of runoff per year. The project is expected to retain approximately 68.6% of runoff.

Rollins Road Burlingame

Concept Description

The Burlingame General Plan identifies Rollins Road as an area that will be targeted for growth and reinvention as a more diverse mixed-use neighborhood with access to transit. As part of this change the city is proposing a road diet and the addition of a class IV bike lane with separated parking to support pedestrian and bicycle activity. This concept proposed to integrate green stormwater infrastructure with the planned transportation improvements.

Linear bioretention planters are proposed as the barrier between the bike lane and driving lane on the south side of Rollins Road. Linear bioretention planters are proposed on the north side of Rollins Road at strategic locations within the parking lane to protect pedestrian crossings and driveways. These bioretention planters will capture stormwater runoff from the roadway and sidewalk. A total of 4,400 square feet of bioretention planter and 6,000 square feet of permeable pavement is proposed, managing stormwater from approximately 3.5 acres of roadway. This project is expected to capture 6.3 acre-feet of runoff per year and retain approximately 69% of runoff.

Grand Avenue South San Francisco

Concept Description

South San Francisco has a goal to revitalize, improve, and support the downtown area. The City plans to improve circulation and connectivity and to create an attractive and vibrant pedestrian environment along the Grand Avenue corridor. This sustainable street concept envisions a reconfiguration of Grand Ave between Maple Ave and Linden Ave with increased pedestrian spaces and integrated stormwater management within green infrastructure facilities.

This project would realign parking from angles to parallel on both sides of Grand Ave to allow space for a bike lane and increased pedestrian areas. The parking lane is proposed to be permeable pavement which will provide infiltration of runoff. The mid-block area is proposed to include a wider sidewalk and colored paving within the

driving lanes to promote traffic calming and increased pedestrian safety. Sidewalk and pedestrian spaces will be installed as boardwalks overlaying bioretention planters. This will provide large stormwater facilities that can manage roadway and sidewalk runoff while preserving space for pedestrian use along the busy commercial and mixed-use corridor. Street trees will be integrated along the parking lane and within the pedestrian boardwalk.

A total of 5,600 square feet of permeable pavement is proposed and a total of 10,200 square feet of bioretention planter integrated in boardwalks are proposed. These are estimated to capture stormwater runoff from approximately 1.2 acres of roadway, providing capture of 2.5 acre-feet of runoff per year. This project is expected to retain 68% or runoff.

Santa Cruz Avenue Menlo Park

Concept Description

Menlo Park has described in their Downtown Specific Plan a desire to renovate Santa Cruz Avenue to create more usable public space, an interest in closing parts of the street for temporary events such as Farmers Markets, and a goal of protecting and enhancing pedestrian amenities. This sustainable street concept proposes a reconfiguration of the street between University Drive and Crane Street to increase pedestrian use spaces and integrate stormwater management within green infrastructure.

On the west side of Santa Cruz Ave, the parking lane is proposed to be realigned from angled parking to parallel parking to increase the available pedestrian space. The parking lane is proposed as permeable pavement with street trees dividing every two spaces. The permeable pavement will infiltration runoff from the street and direct excess flows to the adjacent bioretention planters.

The bioretention planters will integrate vegetation into the pedestrian parklet areas. A permeable boardwalk is proposed that will allow sidewalk runoff to drain to bioretention areas located below the boardwalk. The boardwalk bioretention and bioretention planters will be connected to provide infiltration of runoff from the street, sidewalk, and parking areas. On the east side of Santa Cruz Ave, a similar system of bioretention planters and boardwalks is proposed to provide management of roadway and sidewalk runoff while providing increased pedestrian space.

A total of 2,450 square feet of permeable pavement is proposed and a total of 7,800 square feet of bioretention planter/boardwalks are proposed. These are estimated to manage stormwater runoff from approximately 1.9 acres of roadway, sidewalk, and adjacent roofs, providing capture of 3.6 acre-feet of runoff per year.

3.6 Sustainable Streets Design Examples

Commercial Throughway with Stormwater Planters and Protected Cycle Track

In some conditions along throughways, there is extra paved shoulder space that can be converted into stormwater planters or curb extensions. Depending on how much space there is, it is also possible to introduce a new bike lane or separated cycle track, also known as a protected bike lane, next to the stormwater facilities. Using such an approach helps reinforce the concept of providing more comfortable and family-friendly alternative transportation facilities in concert with managing stormwater runoff treatment. The illustration below showcases this green streets and complete concept.

▲ **RETROFIT OPPORTUNITY:** The same street retrofitted with a series of stormwater planters and pervious pavement, a separated cycle track, and additional street trees.

▲ **EXISTING:** A typical multi-lane throughway's under-utilized paved shoulder in San Mateo County.

▲ **EXAMPLE:** Pavement materials and colors distinguish raised two-way cycle track and adjacent sidewalk. Landscape buffer from plaza and street.

Key Design Elements

- 1 Stormwater planters are placed periodically to capture runoff from the roadway.
- 2 Pervious paving is used in-between stormwater planters.
- 3 Conventional landscape strip with street trees.
- 4 Sidewalk.
- 5 Buffered and protected bike lanes/cycle track.
- 6 Conventional center landscape median.

▲ **EXAMPLE:** Raised two-way cycle track and adjacent sidewalk separated from street by landscaping and stormwater attenuation.

3.6 Sustainable Streets Design Examples

Mixed Use Connector with Stormwater Planter along Parking Lane

Stormwater planters can be added between the outside edge of the sidewalk and the curb, while retaining on-street parking. Pedestrian circulation between parked vehicles and frontage uses can be accommodated by creating walkways in between the planters and a pedestrian step out area adjacent to the on-street parking. The retrofit opportunity illustrated below links a series of infiltration planters. As the upstream stormwater planter fills up with runoff, it overflows out onto the street and enters the next downstream planter. In urban areas, using stormwater planters is advantageous because they allow for stormwater treatment in constrained spaces. Stormwater planters provide a buffer to pedestrians from fast moving vehicles. In addition, the inclusion of stormwater corner bulbouts and striped bicycle lanes should be considered to provide improved complete street benefits and additional stormwater management and treatment.

▲ **RETROFIT OPPORTUNITY:** The same mixed use connector retrofitted with stormwater planters that still provide on-street parking.

▲ **EXISTING:** A mixed use connector street in San Mateo County with on-street parking.

▲ **EXAMPLE:** This stormwater planter provides efficient treatment area in a constrained urban downtown. Pedestrian circulation can be improved by locating parking meters out of the path of travel or using a ticket dispensing system that is not reliant upon pole mounted meters.

Key Design Elements

- 1 Stormwater planters allow for on-street parking with a step out area for people to access their vehicles and the sidewalk.
- 2 Grated curb cuts allow runoff to enter/exit the stormwater facility.
- 3 On-street parking lane.
- 4 Building frontage.
- 5 Sidewalk.
- 6 Bike lane.
- 7 Accessible ADA ramps at street intersection.
- 8 Curb extensions narrow the pedestrian crossing distance, but allow two-way vehicular traffic

▲ **EXAMPLE:** Stormwater planters used along a downtown street. Notice that there is adequate space allocated for people to get in and out of their vehicles and access the sidewalk and frontage uses.

|--|-------------------------------------|---|-------------------------------------|---|-------------------------------------|-------------------------------------|--------------------------|-------------------------------------|-------------------------------------|
|  | |  | |  | | | | | |
| STREET DETAILS | | ADDITIONAL NOTES | | | | | | | |
| Primary Street Being Assessed | Oriente St & Partridge St | Oriente and Partridge are 35' wide, thus providing up to 6.5' of width for curb extensions C1, C2, D1, D2 are all high points. However, curb extension may be feasible for C2 if catch basin were moved, to allow flows to drain without driveway limitations on C1. Due to driveway limitations, curb extensions may not be feasible for GI treatment for flows on western portion of Oriente. | | | | | | | |
| Street Type ^a | Residential | | | | | | | | |
| Available Width (ft) ^b | 6.5' | | | | | | | | |
| 4-CORNER ASSESSMENT | | A1 | A2 | B1 | B2 | C1 | C2 | D1 | D2 |
| Section 1 - Feasibility | | Curb extension not recommended at corner if any of the boxes below are checked | | | | | | | |
| Does not receive any stormwater runoff | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| Underdrain needed and no storm drain at intersection | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Water main on same side of street with dia ≥ 12 inch | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Less than 20 ft from start of corner to first driveway ^c | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| Roadway width is less than minimum required | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Major gas transmission pipeline on same side of street ^d | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Bus stop with concrete pad within footprint | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Longitudinal street slope > 5% | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Large duct bank (≥ 3 ft) within proposed footprint | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Electrical/telecom vault within proposed footprint | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Section 2 - Constraints | | Curb extension not recommended at corner if 3 or more of the boxes below are checked | | | | | | | |
| Duct bank within proposed footprint | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Electrical/telecom vault on sidewalk adjacent to proposed footprint | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Sewer main below proposed footprint | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| Water main < 12 inch dia within proposed footprint | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Fire hydrant at corner | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Depth to groundwater or bedrock < 10 ft | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Open Geotracker cleanup site within 200 ft ^e | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Drainage area to curb extension < 1000 sqft | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Mature tree ≥ 6 inch dia within 20 ft of corner | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Recommended for Curb Extension | no | yes | yes | no | no | yes | no | no | |

- Supports future rapid assessments for opportunities to integrate green infrastructure at intersections
- Excel format
- Check-box results for feasibility at each corner

Sustainable Streets Typical Details

- Building a comprehensive Sustainable Streets Typical Details library to support GI design and implementation
- Integrated with GI Design Guide resources via www.flowstobay.org

Appendix J.3

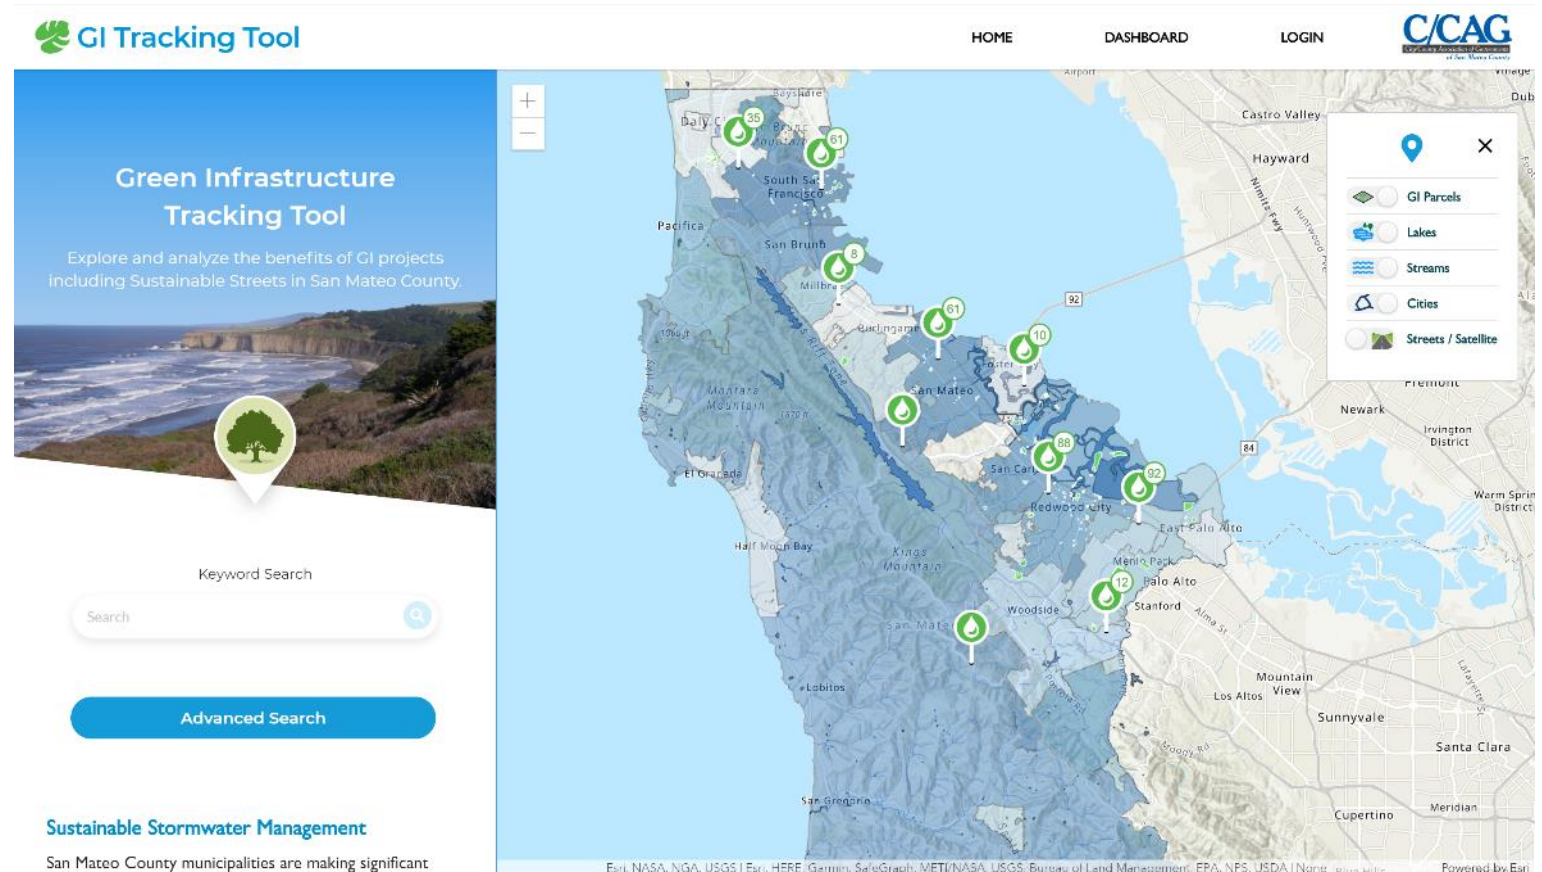

NOT FOR CONSTRUCTION - DESIGNED TO BE USED WITH

Sustainable Streets Policies

- Model Sustainable Streets Resolution and Policy
- Model Sustainable Streets language for municipal plans
- Examples of General and Municipal Plan language
 - Redwood City, Menlo Park, San Mateo, Emeryville
- Model Standard CoAs for Development Projects
- Example Standard CoAs for GI in Development Frontage
 - Menlo Park, Emeryville, South San Francisco, San Mateo, Redwood City
- Example Green Infrastructure Development Standards
 - Redwood City

GI Mapping and Tracking Tool

- Mapping and tracking **ALL** green infrastructure project types
- Supports GI Plan implementation
- Includes water quality and climate change metrics
- Supports public education

Master Plan “Virtual Open House”

Virtual Community Engagement Hub and Open House
December 8, 6-7 PM

Master Plan Schedule

Sustainable Streets Master Plan Schedule

- Master Plan Virtual Open House – December 8, 2020
- Public/Stakeholder Comments on Plan – Mid-December
- CCAG Board Introduction Presentation – December 10, 2020
- Final Draft Master Plan – Mid-January 2021
- Proposed CCAG Board Adoption – February 11, 2021

Reid Bogert – Stormwater
Program Specialist
